# SAR Altimetry Processing for Inland Water : Rivers & Lakes

24 February 2017, Florence, Italy

- SAR Altimetry Training Session -

### **Nicolas Bercher**

Contact : nbercher@along-track.com

SAR Altimetry Processing for Inland Water : Rivers SAR Altimetry Processing for Inland Water : Lakes Online Resources, Conclusion Introduction Background : Main Technical Evolutions Background : Spatial & Temporal aspects Background : Technical Challenges in monitoring inland waters

### Introduction & Background

- 2 Part I SAR Altimetry Processing for Inland Water : Rivers
- 3 Part II SAR Altimetry Processing for Inland Water : Lakes
- Online Resources, Conclusion

SAR Altimetry Processing for Inland Water : Rivers SAR Altimetry Processing for Inland Water : Lakes Online Resources, Conclusion

#### Introduction

Background : Main Technical Evolutions Background : Spatial & Temporal aspects Background : Technical Challenges in monitoring inland waters

# SAR Altimetry for Inland Water : Rivers & Lakes

### Structure of the Inland Water training course

- This presentation is **split in two parts** :
  - SAR Altimetry Processing for Inland Water : Rivers (35')
  - SAR Altimetry Processing for Inland Water : Lakes (25')
- Questions : few minutes reserved at the end of each presentation
- Presentations share introductory and concluding sections
- Really for the new comers in alti-hydrology, but I assume you already know some basics and you have been very assiduous during this training ! :)

SAR Altimetry Processing for Inland Water : Rivers SAR Altimetry Processing for Inland Water : Lakes Online Resources, Conclusion Background : Main Technical Evolutions Background : Spatial & Temporal aspects Background : Technical Challenges in monitoring inland waters

# **Background : Main Technical Evolutions**

### Chronology of past, present & future altimetry missions

From T/P to Jason-3 : 10+ missions since 1992, 25 years of data available.

SAR Altimetry Processing for Inland Water : Rivers SAR Altimetry Processing for Inland Water : Lakes Online Resources, Conclusion Introduction Background : Main Technical Evolutions Background : Spatial & Temporal aspects Background : Technical Challenges in monitoring inland waters

# Background : Main Technical Evolutions

From LRM to SAR and SARIN modes, from Ku to Ka band...

- Orbit accuracy : improved from 1m to few cm !
- Onboard tracking : More recent improvements
  E.g., from Topex to Jason-2 (improved close-loop modes), ENVISAT's variable bandwidth, CryoSat-2 SARIN tracking mode, open-loop / DEM-guided modes
- Retracking algorithms : Lot of efforts

From Brown-based retrackers to empirical (OCOG/Ice1, Ice2, Ice3) and to physical (SAMOSA, new CLS retracker) or numerical (CPP/SAR) retrackers.

• Altimeter modes : from LRM to SAR and SARIN

SAR Altimetry Processing for Inland Water : Rivers SAR Altimetry Processing for Inland Water : Lakes Online Resources, Conclusion Introduction Background : Main Technical Evolutions Background : Spatial & Temporal aspects Background : Technical Challenges in monitoring inland waters

# Background : Main Technical Evolutions

- Altimeter bands : From Ku (all except...) to Ka (...SARAL)
  - Reduced footprint size (a way to improve the across-track resolution of SAR mode, dixit S. Dinardo during this training)
  - Plus other bands : ENVISAT S-Band, Jason-1/2/3 C-band
- **Geophysical corrections** : Instruments (MWR), methods (GPS) and external data (meteo models) :
  - Improved range corrections : dry, wet and iono (even over land surfaces)
  - Improved Geoid models : EGM96, EGM2008, GRACE, GOCE, EIGEN-6C3, EIGEN-6C4, etc.

### Various initiatives related or dedicated to hydrology (...)

Initiative	Year(s)	Туре	Activity/ Status	Product Type	Mission(s)	Altimetry Mode(s)	Main Innovation
GRLM (USGS)	Since 2003	Service	Running	LWL	TBD	LRM	Automated monitoring
HydroWeb (LEGOS)	Since 2005	Service	Need update (up to 2012)	RWL, LWL, LWS, LWV	T/P, ENVISAT, Jason-2	LRM	Extensive coverage, Long Archive
River & Lake	Since 2003	Project (ESA) Service demo	Ended Still running	L2, RWL	ERS-2, ENVISAT, Jason-2	LRM	Multiple retrackers, NRT Service
CASH	2005-2006	Project (CNES)	Ended	L2 Reproc	T/P	LRM	Envisat retrackers applied to T/P
PISTACH (CNES)	2008-2009	Project (CNES) Operational demo	Ended Still running	L2 for coastal/h ydro	Jason-2	LRM	lce3, L2 corrs
PEACHI (CNES)	2013-2015	Project (CNES) Configurable proto	Ended (renewed) Off-line	L2 (for ice)	SARAL/Ka	LRM	Tunable processor, Ka band
CPP (CNES)	Since 2013	Processor	Off-line	L1b, L2 (focused on ocean)	CryoSat-2	SAR (+PLRM)	DDP
REAPER (ESA)	2014	Product	Ended	Off-line L2	ERS-1 ERS-2	LRM	Reprocessing
LOTUS	2014-2017	Project (FP7)	On-going	TBD	Sentinel-3, CryoSat-2	SAR (+PLRM?)	SAR
CRUCIAL	2014-2016	Project (ESA)	On-going	TBD	CryoSat-2	SAR, SARin	SAR, model
SARVatore (ESA)	Since 2014	On-demand service	Available on G-POD	L1b, L2	CryoSat-2	LRM, SAR, SARin (single channel)	First tunable & on-demand SAR processor
DeDop	2015-2017	Processor	On-going	L1b-s, L1b	Sentinel-3 (+CryoSat-2)	SAR	First Open Source SAR processor
DAHITI (DGFI-TUM)	Since 2013	Service	Running	RWL, LWL	many	LRM	Robust editing and Kalman filtering, extensive validation
DTU/lakes (K. Nielsen)	Since 2015	DTU project On-demand data	On-going? Available	LWL	CryoSat-2	LRM, SAR	Robust processing of lakes water levels
HydroSat (GIS/Univ. Stuttgart)	Since 2016	Service	Running	RWL, RWD, others	many	LRM	Extensive coverage, automated

SAR Altimetry Processing for Inland Water : Rivers SAR Altimetry Processing for Inland Water : Lakes Online Resources, Conclusion Introduction Background : Main Technical Evolutions Background : Spatial & Temporal aspects Background : Technical Challenges in monitoring inland waters

# Background : Spatial & Temporal aspects

### Topex/Poseidon ... Jason-3 : 315 km- 10 days

Nicolas Bercher

### Background : Spatial & Temporal aspects

### ERS, ENVISAT, SARAL : 80 km- 35 days

SAR Altimetry Processing for Inland Water : Rivers SAR Altimetry Processing for Inland Water : Lakes Online Resources, Conclusion Introduction Background : Main Technical Evolutions Background : Spatial & Temporal aspects Background : Technical Challenges in monitoring inland waters

# Background : Spatial & Temporal aspects

CryoSat-2:7 km- 369 days (colours: "12.7 subcycles")

SAR Altimetry Processing for Inland Water : Rivers SAR Altimetry Processing for Inland Water : Lakes Online Resources, Conclusion Introduction Background : Main Technical Evolutions Background : Spatial & Temporal aspects Background : Technical Challenges in monitoring inland waters

# Background : Spatial & Temporal aspects

Consequences of the spatial coverage / tracks pattern

- Rivers :
  - More suited to East-West oriented rivers (South-North rivers tend to be parallel to satellite tracks...)
- Lakes :
  - Large lakes are likely to be well covered, possibly by several missions
  - Smaller lakes might be poorly covered or not covered at all !

SAR Altimetry Processing for Inland Water : Rivers SAR Altimetry Processing for Inland Water : Lakes Online Resources, Conclusion Introduction Background : Main Technical Evolutions Background : Spatial & Temporal aspects Background : Technical Challenges in monitoring inland waters

# Background : Spatial & Temporal aspects

### Consequences of the spatial coverage / tracks pattern

- Rivers :
  - More suited to East-West oriented rivers (South-North rivers tend to be parallel to satellite tracks...)
- Lakes :
  - Large lakes are likely to be well covered, possibly by several missions
  - Smaller lakes might be poorly covered or not covered at all !

### Consequences of the temporal revisit

 Rivers & Lakes : Aliasing of the temporal signal (mainly : 10, 27 to 35 days), more critical for rivers which are more dynamic objects

SAR Altimetry Processing for Inland Water : Rivers SAR Altimetry Processing for Inland Water : Lakes Online Resources, Conclusion Introduction Background : Main Technical Evolutions Background : Spatial & Temporal aspects Background : Technical Challenges in monitoring inland waters

# Background : Spatial & Temporal aspects

### Adequacy of a given orbit's spatiotemporal trade-off?

- **Rivers**: Densification of temporal coverage decreases aliasing at the cost of the number of crossings and the capability to estimate rivers slope and longitudinal profile
- Lakes : Densification of spatial coverage increases lake crossing probability at the cost of degraded temporal sampling frequency in the time series (aliasing again).

SAR Altimetry Processing for Inland Water : Rivers SAR Altimetry Processing for Inland Water : Lakes Online Resources, Conclusion Introduction Background : Main Technical Evolutions Background : Spatial & Temporal aspects Background : Technical Challenges in monitoring inland waters

# Background : Spatial & Temporal aspects

### Adequacy of a given orbit's spatiotemporal trade-off?

- **Rivers**: Densification of temporal coverage decreases aliasing at the cost of the number of crossings and the capability to estimate rivers slope and longitudinal profile
- Lakes : Densification of spatial coverage increases lake crossing probability at the cost of degraded temporal sampling frequency in the time series (aliasing again).

But multi-mission can help a lot to densify in both space and time.

SAR Altimetry Processing for Inland Water : Rivers SAR Altimetry Processing for Inland Water : Lakes Online Resources, Conclusion Introduction Background : Main Technical Evolutions Background : Spatial & Temporal aspects Background : Technical Challenges in monitoring inland waters

# Background : Technical Challenges

### Waveform contamination

- Surrounding land, canopy, banks, etc.
- Other waterbodies, swamps, snaking rivers, arms, islands
- Undesired reflectors (urban structures, boats, rice fields !)

All of them reflecting from near nadir or causing off-nadir & side lobes effects

SAR Altimetry Processing for Inland Water : Rivers SAR Altimetry Processing for Inland Water : Lakes Online Resources, Conclusion Introduction Background : Main Technical Evolutions Background : Spatial & Temporal aspects Background : Technical Challenges in monitoring inland waters

# Background : Technical Challenges

### Waveform contamination

- Surrounding land, canopy, banks, etc.
- Other waterbodies, swamps, snaking rivers, arms, islands
- Undesired reflectors (urban structures, boats, rice fields !)

All of them reflecting from near nadir or causing off-nadir & side lobes effects

Important impact on retracking capability (particularly in LRM !)

SAR Altimetry Processing for Inland Water : Rivers SAR Altimetry Processing for Inland Water : Lakes Online Resources, Conclusion Introduction Background : Main Technical Evolutions Background : Spatial & Temporal aspects Background : Technical Challenges in monitoring inland waters

# Background : Technical Challenges

### Waveform contamination

- Surrounding land, canopy, banks, etc.
- Other waterbodies, swamps, snaking rivers, arms, islands
- Undesired reflectors (urban structures, boats, rice fields !)

All of them reflecting from near nadir or causing off-nadir & side lobes effects

Important impact on retracking capability (particularly in LRM !)

### Other issues and sources of errors

- Tracking loss or important hooking = blind to nadir reflectors
- Range corrections (dry & wet tropo vs. syst. bias)

SAR Altimetry Processing for Inland Water : Rivers SAR Altimetry Processing for Inland Water : Lakes Online Resources, Conclusion Introduction Background : Main Technical Evolutions Background : Spatial & Temporal aspects Background : Technical Challenges in monitoring inland waters

# **Background : Technical Challenges**

# Example : LRM Waveforms over the Madeira river (Jason-2 AVISO/S-GDR)

### A lot of reflectors contribute from off-nadir directions !

Nicolas Bercher

SAR Altimetry Processing for Inland Water : Rivers SAR Altimetry Processing for Inland Water : Lakes Online Resources, Conclusion Introduction Background : Main Technical Evolutions Background : Spatial & Temporal aspects Background : Technical Challenges in monitoring inland waters

# **Background : Technical Challenges**

### Geophysical constraints

• Geoid models : resolution vs. inland waterbodies ?

- **Rivers** : impact on river slope (this is poorly known actually) and systematic bias
- Large lakes : can lead to non-flat surface (+ systematic bias)
- Smaller lakes : tend to impact systematic bias only
- Barometric effects + wind stress (large lakes only)

### SARM : Stacks and decontamination

From Fleury and Bercher, LEGOS, 2012.

- Systematically applied in ESA products.
- Efficient on cryosphere and hydrosphere (*i.e.*, specular = low RMSS)
- But side effects over open ocean:
  - Degradation of ground cell resolution (450m instead of 300m)
  - · Possible bias on SWH
  - · Distortion of leading edge
  - Noise and bias in range ?

What's new with SAR altimetry for the monitoring of rivers? The "unique" SARIN mode of CryoSat-2 River Alti-Hydro products Selected papers and applications

SAR altimetry for Rivers : From L1A to L2

# **Key idea** : SAR mode allows to decontaminate the Waveforms by editing the Stacks in Delay and Doppler dimensions.

(Something that is not possible using LRM data.)

# SAR altimetry for Rivers : From L1A to L2

### SARM : Retracking

### (An optimistic point of view)

- Thanks to the improved along-track resolution,
- The Waveforms are naturally sharper,
- And they are naturally less contaminated.

At this stage, we may have done all we could to decontaminate the Waveforms and run a **physical retracker**.

### SAMOSA (cf. Dinardo in this training, Ray et al. 2014)

- Able to cope with changing roughness (from ocean-like to specular Waveforms)
- Hopefully, decontamination procedures will help to isolate the peak of interest in the Waveforms

Nicolas Bercher

What's new with SAR altimetry for the monitoring of rivers? The "unique" SARIN mode of CryoSat-2 River Alti-Hydro products Selected papers and applications

# SAR altimetry for Rivers : From L1A to L2

### SARM : Retracking

### (An optimistic point of view)

- Thanks to the improved along-track resolution,
- The Waveforms are naturally sharper,
- And they are naturally less contaminated.

At this stage, we may have done all we could to decontaminate the Waveforms and run a **physical retracker**.

### (A pessimistic point of view)

Ice1 retracker might be too sensible to the sharpness of the SAR Waveforms and the high threshold value that has to be for such Waveforms.

What's new with SAR altimetry for the monitoring of rivers ? The "unique" SARIN mode of CryoSat-2 River Alti-Hydro products Selected papers and applications

# The "unique" SARIN mode of CryoSat-2

### Main differences between SAR and SARIN modes

### Differences

- SARIN uses two antennas : one to send and two to receive
- Phase difference & coherence between echoes are received via the two antennas (aligned with the waveform samples)
- While SARM emits 4 bursts, SARIN only emits 1 burst
- SARIN has a slightly increased "range noise" than in SARM (but over inland water, somehow... we don't care !)
- In the meantime would SARM have emit his 3 extra bursts, SARIN tries very hard to make its tracking very robust (like a 4x4-altimeter so to say !)

What's new with SAR altimetry for the monitoring of rivers ? The "unique" SARIN mode of CryoSat-2 River Alti-Hydro products Selected papers and applications

# The "unique" SARIN mode of CryoSat-2

### Main Similarities between SAR and SARIN modes

### Similarities

- SAR and SARIN share the same Delay-Doppler Scheme, but it is done twice for SARIN
- SAR waveforms have 128 samples, SARIN waveforms have 512
- SAR and SARIN waveforms can be retracked using the same algorithms (though they have to adapt to the different waveform samples)

What's new with SAR altimetry for the monitoring of rivers ? The "unique" SARIN mode of CryoSat-2 River Alti-Hydro products Selected papers and applications

# The "unique" SARIN mode of CryoSat-2

### Map of SARIN measurements, Solimões river (L2/ESA)

# The "unique" SARIN mode of CryoSat-2

### Map of SARIN measurements, Solimões river (L2/ESA)

SARIN mode correctly relocates off-nadir measurements (Mapping the hydrographic network? Help to improve SNR over rivers?)

What's new with SAR altimetry for the monitoring of rivers? The "unique" SARIN mode of CryoSat-2 River Alti-Hydro products Selected papers and applications

# River Alti-Hydro products : From L2 to time series

Despite the important improvements brought by of SARM over LRM, **the processing of water level time series** (i.e., the Alti-Hydro products) **is very similar** for both modes.

What's new with SAR altimetry for the monitoring of rivers? The "unique" SARIN mode of CryoSat-2 River Alti-Hydro products Selected papers and applications

### Main steps of the Generic Processing (repeat orbit case)

### • Geo-Selection :

 Goal : Using water masks derived from imagery (or predefined virtual stations), collect measurements falling into the area of interest.

### • Editing :

- Goal : discard unusable measurements related to instrument and/or L1A–L2 processing states/failures, etc.
   Based on product "metadata" such as flags, etc.
- Can be a difficult task, rules are products-dependent
- Advices : read user's handbook, explore product flags, read netCDF files internal comments, explore your data !

### • Filtering of the time series :

 Goal : discard outsider measurements which are not in good agreement with the main water level trend(s) (seasonal, spatial), cf. selected papers.

Online Resources, Conclusion

What's new with SAR altimetry for the monitoring of lakes ? Lake Alti-Hydro products Geoid estimation from CryoSat-2 geodetic orbit, SARM Selected papers

# SAR altimetry : Lakes vs. Rivers

The "Background" and "Rivers" sections in **PART I** introduced SARM for rivers.

Most of what have been presented so far **remains valid for lakes**. But usually, the more a lake is large, the less the processing is complex.

In **Part II**, we will highlight the major differences, between rivers and lakes, related to SARM.

What's new with SAR altimetry for the monitoring of lakes ? Lake Alti-Hydro products Geoid estimation from CryoSat-2 geodetic orbit, SARM Selected papers

# SAR altimetry for Lakes : From L1A to L2

Major differences between rivers and lakes

• Lakes processing : Measurement conditions are usually close to those of the ocean (central part) or the coastal zones (closer to the banks)

### • Large lakes :

- Waveforms contamination is not an issue, except close to lake banks (less true in SARM than in LRM)
- The measurement of atmospheric corrections (MWR) is not an issue far enough from the banks
- Smaller lakes : conditions similar to rivers
  - Waveforms contamination is likely to be an issue
  - Atmospheric corrections are to be derived from ancillary data (meteo models, GPS)

### Main differences in the Processor configuration

### **Delay-Doppler Processor**

• Editing of the Stacks (Hamming) : might be not required for larger lakes but required for the smaller ones

### Retracking

- A physical retracker like SAMOSA might be suitable for all lake sizes
- What about empirical retrackers like Ice1 ?

### Atmospherical corrections

Same issue than for LRM missions...

What's new with SAR altimetry for the monitoring of lakes ? Lake Alti-Hydro products Geoid estimation from CryoSat-2 geodetic orbit, SARM Selected papers

# Lake Alti-Hydro products

### • Lakes processing :

 Due to larger crossing sections (compared to rivers), a lot of measurements are collected after each overflight

### • Large lakes :

- The larger crossing sections allows/requires the refinement on the estimation of the local geoid using altimetry data
- Usually good spatial coverage & temporal sampling (multi-mission) : "simplified" processing of the water level time series

### Smaller lakes :

- The constraints are similar to those of rivers
- The resulting time series might **expose larger bias** than for large lakes

### Nielsen et al., 2015

Robust estimation of lake water levels, CryoSat-2 SAR data, lake Vänern + 4 others.

An open source "R" package is available online, it implements an along-track filter, based on the description of the meas. noise.

Nicolas Bercher

Arsen et al., 2014 : Validation of SARAL over medium and small lakes, derived a trend between vertical RMS Error and lake-track cross-sections. Though not in SAR mode, the results clearly depict the benefit of a reduced footprint size.

Figure 7 Accuracy with respect to the length of the cross sections.

### 1 Introduction & Background

2 Part I – SAR Altimetry Processing for Inland Water : Rivers

### 3 Part II – SAR Altimetry Processing for Inland Water : Lakes

Online Resources, Conclusion

Online Resources Conclusion

# **Online Resources**

 www.altimetry.info : Documentation and much more ! Topics : Toolbox, Code, Data Access, Links, Altimetry Tutorial, Use Cases, Missions, Helpdesk

#### • Data access :

- L1b/L2 : ESA, AVISO+ (incl. PEACHI), LEGOS/CTOH, NASA/PO.DAAC, PISTACH
- Alti-Hydro portals : HydroSat, DAHITI, HydroWeb, River&Lake
- Software and toolboxes : BRAT, MAPS, VALS, K. Nielsen's "R" tool for lakes processing

Online Resources Conclusion

# Conclusion

### Satellite Altimetry

- Already 25 years of data from 12 missions
- Important improvements in vertical noise, orbit, etc.
- Several innovative projects, services
- SARM : Several alternative Delay-Doppler processors

### Altimetry and Hydrology

- Trade-off & limitations related to space & time
- Lots of technical challenges due to land surfaces
- Rivers & Lakes : different cases...

Online Resources Conclusion

# Conclusion

### Altimetry, SARM & Rivers monitoring

- Rivers : complex, dynamic objects (water level variations, topography, morphology)
- Require specific processing at each stage, from L1A to L2, and to Alti-Hydro Products (time series)
- Waveforms contamination is the biggest challenge
- Atmospherical corrections are derived from models

Online Resources Conclusion

# Conclusion

### Altimetry, SARM & Lakes monitoring

- Lakes are less complex than rivers, though smaller lakes requires similar care than rivers
- Extended cross-sections allow/require to refine the local geoid model
- Waveforms contamination is of mitigated impact, depending on lake size
- Atmospherical can be measured over central sections of the larger lakes, or corrections derived from models

Online Resources Conclusion
